                       The present sequence is one of ten oligonucleotides that may be targeted to tyrosinase related protein 2 (TYRP2) mRNA for delivery to a patient receiving anti-cancer therapy for melanoma. The oligonucleotides can be used to treat cancer, especially melanoma. They may be used for reducing resistance to an anti-cancer therapy in melanoma cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequence for the Muman tankyrase2 protein. This is found in two different versions, designated TANK2-LONG and TANK2-SHORT. Tankyrase2 has polyADP-ribosylation activity and is involved in the modification of TRF1, which is a telomeze-specific binding protein. The regulation of telomere length, in which TRF1 has a role, is linked to ageing and cancer. The sequences are useful in the treatment of cancers and inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    mediated by cancers,

The present invention provides the protein and coding sequence for the human tankyrase2 protein. This is found in two different versions, designated TANK2-LONG and TANK2-SHORT. Tankyrase2 has polyADD-ribosylation activity and is involved in the modification of TRF1, which is a telemere-specific binding protein. The regulation of talomere length, in which TRF1 has a role, is linked to ageing and cancer. The sequences are useful in the treatment of cancers and inflammatory
                                                                                                                                                                                                                                                                                                                                                            New tankyrase2 polypeptides, useful for treating conditions mediated by poly(adenosine diphosphate-ribose) polymerase activity e.g. cancers, inflammatory and autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                  The present sequence is that of a phosphorothicate sense oligonucleotide that corresponds to the Kozak sequence of SAMID mRNa. It was microin-jected into mouse cocytes where, unlike the corresponding antisense sequence (see ABL5527), it did not selective inhibition of SAMID mRNA. SAMID is a receptor of meiosis activating sterols (MAS) and is involved in the gamete maturation process induced by 3beta-hydroxy-4, dimethylcholest-8,14,24-triene (FF-MAS), specifically inducing, upon ligand activation germinal vesicle breakdown in occytes. The invention polyopebides, probes, host cell lines and antibodies, as well as methods of screening for agonists or antagonists of FF-MAS activity. These may be used to diagnose, prevent and treat diseases associated with inappropriate MAS receptor expression. The MAS receptors can be used to diagnose to prevent and treat diseases associated with
                                                                                                                                                                                                                                                    Receptors and signaling proteins of Meiotic Acting Sterols and nucleic acids, useful in modulating in gamete maturation process induced by 3beta -hydroxy-4,4-dimethylcholest-8,14,24-triene.

The present sequence is that of a phosphorothicate antisense oligonucleotide that is complementary to the Kozak sequence of SAMID manna. It was microinjected into mouse coortes where it exhibited selective inhibition of SAMID mRNA. It are respons of meiosis activating sterols (MAS) and is involved in the gamete maturation process activating sterols (MAS) and is involved in the gamete maturation process is pecifically inducing, upon ligand activation, germinal vesicle breakdown in cocytes. The invention provides SAMID polynucleotides (including RNA antisense sequences), polypetides, probes, host cell lines and antisense sequences), polypetides, probes, host cell lines and antisense associated with inappropriate for agonists or antagonists of FF-MAS activity. These may be used to diagnose, prevent and treat receptors can be used to discover profertility and antifertility mas receptors can be used to discover profertility and antifertility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Receptors and signaling proteins of Meiotic Acting Sterols and nucleic acids, useful in modulating in gamete maturation process induced by 3beta -hydroxy-4,4-dimethylcholest-8,14,24-triene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, cancer; autoimmune disease; organ transplantation; infection; allergy; vaccine; dendritic cell therapy; immune response; primer; ss; dendritic cell wall membrane molecule; immunogenic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated human dendritic cell wall membrane molecule comprising a defined amino acid sequence given in the specification, or its variant based on the amino acid sequence but with some amino acids deleted, substituted, inserted and/or added and capable of controlling immune response. The protein, variants and encoded DNAs are useful in producing antibodies and soluble molecules to separate or detect dendritic cells, and for treatment of cancer, autoimmune diseases, organ transplantation, infection and allergy, e.g. by cancer vaccines and dendritic cell therapy to control immune response through promotion or suppression of the interaction between dendritic cells and T cells. The human dendritic cells wall membrane increases expression with maturation of human dendritic cells. The present sequence represents a human dendritic cell wall membrane molecule-associated primer
                                                                            Isolated dendritic cell wall membrane, variants and their encoded DNAs, useful in producing antibodies and soluble molecules to separate or detect dendritic cells, and for treatment of cancer, autoimmune diseases and infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated dendritic cell wall membrane, variants and their encoded DNAs, useful in producing antibodies and soluble molecules to separate or detect dendritic cells, and for treatment of cancer, autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated human dendritic cell wall membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, cancer, autoimmune disease, organ transplantation, infection, allergy, vaccine, dendritic cell therapy, immune response, primer, ss, dendritic cell wall membrane molecule, immunogenic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
molecule comprising a defined amino acid sequence given in the specification, or its variant based on the amino acid sequence but with some amino acids deleted, substituted, inserted and/or added and capable of controlling immune response. The protein, variants and encoded DNAs are useful in producing antibodies and soluble molecules to separate or detect dendrific cells, and for treatment of cancer, autoimmune diseases, organ transplantation, infection and allergy, e.g. by cancer vaccines and dendritic cell therapy to control immune response through promotion or human dendritic cell wall membrane increases expression with maturation of human dendritic cells. The present sequence represents a human confined to the present sequence represents a human control or the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to novel pyruvate carboxylase proteins and polymuclochides encoding such proteins. Sequences of the invention are important anaplerotic enzymes for replenishing oxaloacetate consumed for biosynthesis during growth, or lysine and glutamic acid production in industrial fermentation. The present DNA sequence is a primer which is used to obtain C. glutamicum pyruvate carboxylase gene. This primer is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Endfor2 primer used to obtain C. glutamicum pyruvate carboxylase gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel pyruvate carboxylase polypeptide, useful for replenishing oxaloacetate consumed for biosynthesis during growth, or lysine and glutamic acid production in industrial fermentation.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is descrede from the resultant complified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell plates; (e) the clones in the mixed clones are cultured and the resultant cultures are amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42057 to ABL45322 represent represent FOR primers for human chromosome 21q221, which are represent represent for human chromosome 21q221, which are specifically claimed for use in the present invention
                                                                   chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hybridising, quantification; detection; synthesis; amplification; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid detection and discrimination related primer SEQ ID No 37.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1.6%; Score 13.6; DB 1; Length 20; 80.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotide encoding human cytohesin-1, useful for preventing or treating a disease or condition associated with cytohesin-1 expression e.g. tumor or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a new antisense compound, comprising 8-30 nucleobases targeted to a nucleic acid molecule encoding human cytohesin-ty specifically hybridises with, and inhibits the expression of, human cytohesin-1, a guanine nucleotide exchange protein for ARF (ADP ribosylation factor). The antisense compound may be used in a pharmaceutical composition for inhibiting the expression of cytohesin-1 in human cells or tissues, and in treating a disease or condition associated with cytohesin-1 by administering to the human the antisense compound e.g. tumour or inflammation. The antisense compound is also useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. The present sequence is an antisense oligonucleotide targeting human cytohesin-1
                                                                                                                                                                                                                                                                                                                                             Human; antisense; cytohesin-1; guanine nucleotide exchange protein; ARF;
                                                                                                                                                                                                                                                                                                     Human cytohesin-1 coding region antisense oligonucleotide, ISIS#111012.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

```
The invention comprises antisense oligonucleotides which inhibit expression of the human RECQL gene. The antisense oligonucleotides of the invention are useful for modulating the expression of RECQL protein and in treating hyperproliferative disorders (e.g. cancer and conditions in treating premature againg. The antisense oligonucleotides of the invention are also useful for diagnostics, therapeutics and prophylaxis (e.g. to prevent or delay infection, inflammation or tumour formation). The present DNA sequence represents an RECQL antisense oligonucleotide of the invention. NOTE: The present DNA sequence contains a phosphorothicate backbone, nucleotides 1-5 and 16-20 are 2'-methoxyethyl (2'-MOE)
                                                                                                                                                                                                                                                             New antisense oligonucleotides targeted to a nucleic acid encoding RECQL, useful for modulating the expression of RECQL protein, or for treating a disease or condition associated with the expression of RECQL, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New conjugate probes comprising a chemical or biomolecule coupled to a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a composition comprising one or more nucleic acid molecules and at least one oligonucleotide, where at least a portion of the oligonucleotide is capable of hybridising with at least a portion of the nucleic acid molecule and where the oligonucleotide comprises a modified nucleotide at or near the 3'-terminal nucleotide. The various analogue oligonucleotides are useful for quantification or detection of one or more target nucleic acid molecules in a sample during nucleic acid contraction or detection of synthesis or amplification. The analogues are also useful for determining the presence or absence of one or more particular nucleotides at a specific position or positions in a target nucleic acid molecule. The analogue oligonucleotides can also be useful for synthesising or amplifying one or more nucleic acid molecules. Any mixing one or more nucleic acid molecules complementary to all or a portion of the templates or targets with the analogue oligonucleotides, and incubating the mixture to synthesise or amplify one or more nucleic acid molecules complementary to all or a portion of the templates or targets. This polynucleotide sequence represents a nucleic acid detection and discrimination related PCR primer of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; antisense therapy; ss; RECQL; hyperproliferative disorder; cancer; premature ageing; infection; inflammation; tumour formation; 2'-MOE; antisense oligonucleotide; phosphorothioate backbone; 2'-methoxyethyl.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Composition comprising nucleic acid molecules and a oligonucleotide capable of hybridizing with a portion of nucleic acid, and comprises a modified nucleotide at or near the 3'-terminal nucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

                                                                                     sensor comprising a chemical or biomolecule coupled to a dial-containing polymer, a linear or branched polysaccharide, a polymuclectide having a bydroxyl group vicinal to a phosphodiester linkage, or to a polymer selected from RNA, poly(T), phosphodiester linkage, or to a polymer selected from RNA, poly(T), poly(U) and poly(A). The conjugate probes are useful in industrial, enronmental, biomedical and biotechnology fields. Conjugate probes may be used in analytical or diagnostic applications, and in detecting analytes in a solution, gas or solid phase. The cornjugate probes may further be used to detect binding of a molecular structure to the signal path, to identify secondary binding, and to generate a standard curve or titration curve that would be used analyte or ligand. The present DNA sequence represents a Neisseria meningitidis DNA PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .
ໝ
                                                                        invention comprises a conjugate probe for detecting analytes, with a sor comprising a chemical or biomolecule coupled to a diol-containing
useful for detecting analytes in a solution, or for detecting inorganic, or environmental particles in an analyte.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           protease; murine; gene therapy; screening; diagnosis; capn12;
                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New calpain protein 12 with cysteine protease activity, useful for treating specific deficiency disorders.

```

This invention describes a novel murine calpain protease 12 (caph12). The calpain protease of the invention, related proteins and nucleic acid that encodes it, are useful for treatment (including gene therapy) of diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  lipid regulation comprising identifying a molecule that binds to or inhibits binding of a molecule to high bone mass (HBM) or its wild type gene, Zmax1. Compounds identified by the method are useful for treating, diagnosing, preventing or screening for normal and abnormal lipid-associated conditions, including arteriosclerosis, cardiovascular disease, trook, and osteoporosis. The compounds may also be used in the treatment or prevention of diabetic atherosclerosis, neurovascular conditions caused by plaque build-up, poor circulation due to plaque build-up, most of methods may be used in elevatory, pharmaccutical development, and diagnostic assays for bone development disorders. Molecules identified by comparison of Zmax1 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method for identifying a molecule involved in
associated with insufficient expression of the calpain protease. The protein is also used to screen for calpain protein effectors and to raspecific immunoglobulins (Ig) useful for diagnosis. Also the polymucleotide encoding capnil is useful, e.g. as primers and probes, diagnosis of diseases, or predsipposition to them, and for recombinant production of capnil. This sequence represents the murine calpain 12, capnil splice acceptor site described in the disclosure of the
                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying molecules involved in lipid regulation, useful for diagnosing, treating or preventing e.g., arteriosclerosis, comprises identifying a molecule that binds to high bone mass gene or its corresponding wild type gene.
                                                                                                                                                                                                                                                      0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a compound 8 to 50 nucleotides in length targeted to a nucleic acid molecule encoding a BH3 interacting domain death agonist, where the compound specifically hybridises with and inhibits the expression of the BH3 interacting domain death agonist. The compound of the invention is useful for inhibiting the expression of the BH3 interacting and animal having a disease or condition associated with the BH3 interacting domain death agonist, e.g. associated with the BH3 interacting domain death agonist, e.g. developmental thematopoletic disorder, hyperproliferative disorder, e.g. developmental disorder, immunological disorder, or a disease or condition of the liver e.g., hepatitis, or a condition associated with apoptosis. The compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents an antisense oligonucleotide inhibitor of the DNA from human BH3 interacting domain
HBM systems can be used as surrogate markers in pharmaceutical development, in diagnosis of human or animal bone diseases, and in the treatment of bone diseases. SARZ2776-ABK23411 represent CDNA molecules encoding human Zmax1 and HBM, and PCR primers, probes, linkers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antisense compound targeted to nucleic acid molecule encoding the BH3 interacting domain death agonist, useful for treating animals with diseases associated with BH3 interacting domain death agonist, e.g.

The invention also relates to methods of inhibiting hyperproliferation of calls which involves contacting the hyperproliferation of calls which involves contacting the hyperproliferating cells with a therapeutically effective amount of an oligonucleotide of the invention. The method is useful for treating cancer, angiogenesis or neovascularisation, especially ocular angiogenesis or neovascularisation. The present DNA sequence is an
death agonist RNA of the invention. NOTE: This sequence is a chimeric oligonucleotide 20 nucleotides in length, which is flanked on both sides by five-nucleotide 'wings'. The wings are composed of 2'-methoxyethyl (2'-MCE) nucleotides. The internucleoside (backbone) linkages are phosphorothioate (P=S) throughout the oligonucleotide. (Updated on 29-AUG-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a new antisense compound targeted to human glioma-associated oncogene-2. The invention is useful for inhibiting the expression of human glioma-associated oncogene-2 in cells or issues. The invention is also is useful for treatment of diseases associated with human glioma-associated oncogene-2. The invention is further useful for disappositics, therapeutics, prophylaxis, as research reagents and kits, for distinguishing functions of various members of a biological pathway, and in antisense gene therapy. The invention is also useful prophylactically, e.g., to prevent or delay infection, inflammation or tumour formation. The present nucleic acid sequence represents an oligonucleotide that was used in the methods of the invention to inhibit human glioma-associated oncogene-2
                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel antisense compound that hybridizes and inhibits nucleic acid encoding human glioma-associated oncogene-2, useful for treatment of diseases associated with human glioma-associated oncogene-2.

The invention relates to a novel antisense compound of 16-30 nucleotides targeted to any of 71 specified regions of the sequence that encodes human cytohesin-1 (CTI), where the compound hybridises and inhibits expression of human CTI. The compound of the invention has antiinflammatory, cytostatic, and anti-infective activity. The antisense compounds may have a use in antisense gene therapy. The antisense compounds are useful for treating or preventing disorders associated with expression of human CTI, e.g. infections, inflammation and tumours, and as research and diagnostic reagents. Sequences ABG66412-ABG6651 represent chimeric phosphorothicate oligonucleotides, with 2-MOE wings and a deoxy gap. The claimed sequences inhibit production of cytohesin-1
                                                        New antisense compounds directed against human cytohesin-1, useful for treating and preventing infection, inflammation and tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human RecQ protein-like 4 (RECQL4) DNA antisense oligonucleotide #46.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, RecQ protein-like 4, RECQL4, ss, chromosome 8q24, infection,

like 4, useful for modulating expression of the nucleic acid and treating
diseases associated with expression of the nucleic acid in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a compound targeted to specific nucleobases of RecQ protein-like 4 (RECQL4) and which hybridises and inhibits the expression of RECQL4. The compound is useful for inhibiting the expression of RECQL4. The compound is useful for treating an animal, particularly a human suspected of having or being prone to a disease or condition associated with expression of RECQL4. The compound is useful for diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. This sequence represents an antisense oligonucleotide used in inhibition of human RECQL4 expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, K-ras, PCR primer, probe, capture probe, mutation detection, ligase detection reaction; LDR, p53; BRCA1, BRCA2; infectious disease, infection; 21 hydroxylase deficiency, Turner Syndrome, obesity, cancer, oncogene, tumour suppressor; human papillomavirus; forensic; environmental monitoring; food industry; feed industry; ss.
inflammation; tumour formation; cancer; cytostatic; antiinflammatory; antimicrobial; antisense therapy; antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention describes a method (MI) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria mmoncytogenes and Hamophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Caddida albicans and Sapergillus funigatus, viruses e.g. T-cell lymphocytotrophis cirus, Bestein-Barr virus and polio virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamoba histolytica and Dracumculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obserity defects.

Cometring cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCAH gene, psi gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning celectron microscope and infrared microscope) the support at the parentcular sites and identifying if ligation of the oligonucleotide properce or absence of the target nucleotide sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, antisense, lung dysfunction, nasal airway dysfunction, antinflammatory steroid, ubiquinone, antinflammatory; antiallergic, antiasthmatic; hypotensive, immunosuppressive, cytostatic; gene therapy, antisense gene therapy, respiratory; lung, adenosine sensitivity, adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.
                                                                                                                  Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions; 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubjquinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of cof, or reducing sensitivity to adenosine, reducing or depleting levels or receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubguinone or lung surfactant in a subject's fissue, or treating bronchoconstriction, note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at fip. wipo.int/pub/published_pot_sequences

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Claim 15; SEQ ID NO 1904; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligomuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleocides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubjudinone. A composition of the invention has mutinflammatory, antiallergic, antiasthmatic, hypotensisty an antiinflammatory, antiallergic, antiasthmatic, hypotensive, in antiinflammatory and cytostatic activity. The composition may have a use in antisectory, lung or malignant disease or condition, as lso preventing a respiratory, lung or malignant disease or condition, as lso or expending sensitivity to adenosine, reducing or depleting levels of antiinflammatory steroid in a subject, for reducing or depleting levels of adenosine receptor, producing bronchodiation, increasing levels of ubjudinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung alta for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 6' regions within 2-10 mucleotides of inctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention of the invention of the invention of the invention of the antiinflammatory antiallergic, antisthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an infilammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or a respiratory disease or condition, note: The sequence date for this patent is not represented in the printed or specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                  Pharmaceutical composition for treating ailments associated with impaired

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

Disclosure; SEQ ID NO 2715; 872pp; English

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' or an all actions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunctions of second active agent comprising an artifilanmatory steeroid and ubiquinone. A composition of the invention has antiinflammatory steeroid and ubiquinone. A composition may have a immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiformatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO ftp.wipo.int/pub/published_pct_sequences

(EPIG-) EPIGENESIS PHARM INC

Ö Aguilar Pabalan J, Katz E, ŝ Li Y, Sandrasagra A, Tang L, Shahabuddin Nyce JW, I Miller S,

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure, SEQ ID NO 13041; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligomucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an cartinflammatory seroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, comparising an intisense gene therapy. The composition may have a comparison and cytostatic activity. The composition may have a comparison to preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or treating bronchoconscription, lung allergies, or a respiratory disease or condition, lung inflammation, but was obtained in electronic format directly from WIPO ftp.wipo.int/pub/published_pct_sequences

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' on antisense to the stations of genes encoding a polypeptide associated with lung and/or nasal airway dysfunctions and a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antinflammatory, antiallergic, antiasthmatic, hypotensing, an antinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, as 1so for enhancing the prophylactic or therapeutic respiratory effect of an antinflammatory steroid in a subject, for reducing or depleting levels of of antishlammatory brombodilation, increasing levels of adenosine receptor, producing brombodilation, increasing levels of adenosine receptor, producing brombodilation, increasing levels of adenosine receptor, producing brombodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung albert is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                             Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding a hormone-sensitive lipase (HSL) or a splice variant of HSL. The compound specifically hybridises with and inhibits the expression of HSL or a splice variant of HSL, or specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding HSL. (I) have anorectic, antidiabetic and cytostatic activities, and can be used in antisense therapy. (I) is useful for treating an animal, particularly human, suspected of having an abnormal metabolic condition such is obesity, hyperlipidaemia, type 2 diabetes, a hyperproliferative disorder such as cancer (e.g. pitulitary, colorectal, breast, testicular, pulmonary or epithelial cancer). (I) is also useful in modulating blood glucose epithelial cancer. (I) is also useful in modulating blood glucose animal. The present sequence represents a mouse hormone-sensitive lipase chimeric phosphorothioate antisense oligonucleotide, which is used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, Taqman, probe; ss, asthma, bronchial hyperresponsiveness, airway obstruction, chronic bronchial inflammation, multifactorial disease, asthma-associated gene; AAGA, allele-specific, single nucleotide polymorphism; SNP, genetic profile; gene therapy; authli distress respiratory syndrome; chronic obstructive pulmonary, chronic bronchitis; dyspnea.

The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA265, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense oligonuclectides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.
                                                                                                                                                                                                                                                                                          /note= "Phosphorothioate backbone; All cytidines are 5-methylcytidines"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention discloses a method for determining a disease (e.g asthma) characterised by bronchial hyperresponsiveness, or the risk of developing than a trand airway obstruction or chronic bronchial inflammation. Asthma is a multifactorial disease, so discovery of the asthma susceptibility genes can identify the fundamental mechanisms behind asthma. One such gene is the asthma-associated gene, AAGA. Also disclosed is an allele-specific prolated polymuclectide probe capable of detecting a polymorphism, an isolated polymuclectide, and encoded polypeptide, which is a variant of hards associated with bronchial hyperresponsiveness and methods for pharmacogenemically selecting a therapy to be administered to an individual having asthma, comprising determining an AAGA genetic profile individual having the individual's genetic profile to an AAGA genetic profile comparing the individual's genetic profile to an AAGA genetic profile comparing the individual's genetic profile to an AAGA genetic profile comparing the individual's genetic profile to an oligonuclectide, polypeptide encoded by it, antibody to the polypeptide, or an oligonuclectide, polypeptide encoded by it, antibody to the polypeptide, or an oligonuclectide, polypeptide encoded by it, antibody to the polypeptide, or an oligonuclectide, polypeptide encoded by it, antibody to the polypeptide, or an oligonuclectide encoded by it, antibody to the polypeptide, or an oligonuclectide by bronchial hyperresponsiveness, or inflammatory syndrome, chronic obstructive pulmonary, chronic bronchitis or dyspnea. The method is useful for prognosing, diagnosing or confirming that a symptomatic subject has a genetic defect which causes or contributes to the particular disease or disorder, for ascertaining an individual's genetic profile. The sequences presented is a human AAGA single nucleotide polymorphism the sequences presented is a human AAGA single nucleotide polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Determining whether a subject has or is at risk of developing a disease characterized by bronchial hyperresponsiveness, comprises determining the expression or bioactivity level of an asthma-associated gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Human, superoxide dismutase 1, antisense, neuroprotective, cytostatic, antiinflammatory, amyotrophic lateral sclerosis, apoptosis, hyperproliferative disorder, therapy, infection, inflammation, tumour,

Human superoxide dismutase 1 antisense inhibitor # ISIS 150455.

23-MAY-2003 (first entry)

ACC40901

```
Novel antisense oligonucleotide which is targeted to mRNA encoding human raf and which is capable of inhibiting raf expression, useful for treating or preventing hyperproliferative conditions such as cancer.
                  Human; ss; antisense; c-raf; a-raf; b-raf; protein kinase; cancer; signal transduction; cell proliferation; lung carcinoma; cytostatic; antisense gene therapy; chemotherapeutic agent; angiogenesis; hyperproliferative condition; neovascularisation; ocular angiogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1.6%; Score 13.6; DB 1; Length 20; 30.0%; Pred. No. 4.7e+02;
Antisense oligonucleotide targeting human a-raf, ISIS9063.
                                                                                                                                                             95WO-US007111.

The invention relates to an oligomucleotide 8-50 nucleotides in length which is targeted to mRNA encoding human c-raf, a-raf or b-raf (raf is a prochin kinase playing a regulatory role in signal transduction, regulating cell proliferation and has been implicated in lung carcinoma), and which is capable of inhibiting raf expression. Also included is a competable carrier. The antisense oligomucleotide is useful for competable carrier. The antisense oligomucleotide is useful for inhibiting the expression of human raf in human cells or tissues, by contacting the human cells or tissues with the oligo. The oligo. Is also is useful for treating or preventing a disease or condition associated with the expression of raf by administering it in combination with a chemotherapeutic agent to a human or cells of the human, where the expression of raf is abnormal expression, and the condition is a hyperproliferative condition such as cancer, angiogenesis or neovascularisation (preferably ocular angiogenesis or neovascularisation). The oligo. Is also useful is to inhibiting hyperproliferation of cells. The oligos, are also useful as tools, for example for detecting and determining the role of raf expression in various cell functions and physiological processes and conditions and for anamone of the expression in the expression of the expression of the example for detecting and determining the role of raf experient means the expression of the example for detecting and determining the role of reference of the experient means and physiological processes and conditions and for discount means and physiological expression and for example for the expression and for example for the expression and for example for the expression and for example for the expression and for example for the expression and for example for the expression and for example for example for example for example for example for example for example for example for example for example for example for example for example for example for example for example for example fo

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human supercxide dismutase 1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-compounds of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothibate compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel antisense compounds targeted to nucleic acids encoding human superoxide dismutase 1, for modulating expression of the dismutase and treating diseases or conditions, e.g. amyotrophic lateral sclerosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to antisense compounds, compositions and methods for modulating the expression of protein kinase R (also known as PRR, perRx, interferon-induced double stranded RNA-activated pse kinase, DAI, dsI, and Pl/eIF2 alpha protein kinase). The compositions contain antisense compounds, particularly antisense oligonucleotides targetted to nucleic acids encoding PKR. The antisense compound is useful for inhibiting the expression of PKR and for modulating the process of mediated interference (RNAi) in a cell. It is useful for treating an animal having a disease or condition associated with PKR. It is also useful for diagnostics, therapeutics, prophylaxis, as research reagents and kits, for distinguishing functions of various members of biological pathway, and in antisense gene therapy. It is useful prophylactically,

The compound is used for treating an animal having a disease or condition associated with dual specific phosphatase 5 such as a hyperproliferative disease with a developmental disorder, an inflammatory disorder or a disease which arises from aberrant apoptosis sequences ABX09062-ABX09139 represent human dual specific phosphatase 5 phosphorothioate oligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense modulation of dual specific phosphatase 5 expression used in treating disorders e.g. inflammatory diseases.
                                                                                                                                                                                                                                                                   Human dual specific phosphatase 5 phosphorothioate oligonucleotide #78

-20 are 2'-methoxyethoxy (MOE) nucleotides, nucleotides 7
-14 are 2'-deoxy- nucleotides, all C nucleotides are 5-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense compound, useful for preparing a composition for diagnosing, treating or preventing inflammatory diseases, e.g. rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel antisense compound, which is 8-30 mucleobases in length targeted to a nucleic acid molecule encoding p38 mitogen-activated protein Kinase (MAPK). The products of the invention have antiarthritic and antiliflammatory activity, can act as act as kinase inhibitors. The antisense compound is useful for preparing a composition for diagnosing, treating or preventing inflammatory diseases, e.g. rheumatoid arthritis or for use in antisense gene therapy. This sequence represents an antisense oligonucleotide used in a method to
                                                                                                                                                                                                                                                                         p38 mitogen-activated protein kinase; p38 MAPK; phosphorothioate; antisense; antiarthritic; antiinflammatory; kinase inhibitor; human; inflammatory disease; rheumatoid arthritis; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

The invention relates to novel transgenic animals expressing the high bone mass (HBM) gene, expressing the corresponding wild type HBM gene, comprising an alteration of the gene encoding LRPS or LRP6, or expressing an LRP5 that is modulated by an altered gene control sequence introduced by nomologous or non-homologous recombination. The transgenic animals are invention has osteopathic and cytostatic activity. The polymucleotides of the invention may have a use in gene therapy. The pransgenic animals and nucleic acids are for the study of bone density modulation, where the bone mass is modulated relative to non-transgenic animals of the same species in more than one parameter selected from bone density, bone species in more than one parameter selected from bone density, bone transgenic animals, nucleic acids and methods are useful for identifying compositions, which may be employed for treating or preventing bone diseases, e.g. osteoporosis, osteomalacia, rickets, Paget's disease, or neoplasms of the bone. The transgenic animals and nucleic acids are also useful in methods for disaposing diseases involved in bone development, or characterised by reduced bone density or mass. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

New antisense oligonucleotides targeted to nucleic acid encoding protein kinase A regulatory subunit RII beta, useful in treating diseases e.g. cancer associated with the aberrant expression of the protein kinase.

```
The invention discloses antisense oligonucleotides that specifically hybridise with a region encoding human serum amyloid A4 (SAA4) and inhibit its expression. Lipoproteins are globular, micelle-like particles which have been classified into five categories. The protein components of lipoproteins are known as apolipoproteins, and one family of these are the serum amyloid proteins. These apolipoproteins are associated with the high density lipoprotein. These apolipoproteins of the amyloid proteins of the amyloid and act as precursors of the amyloid A proteins found in amyloid fibril deposits formed during the process of amyloidosis. The antisense compounds and methods are useful for modulating, (i.e. inhibiting) the expression of serum amyloid A4 (antisense therapy) diseases associated with elevated expression of serum amyloid A4, e.g. tumour formation or inflammatory disorders such as rheumatoid arthritis and familial Mediterranean fever.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The antisense compounds can also be used as research reagents and diagnostics, or as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion or the entire complement of genes expressed within cells or tissues. The sequences presented in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ABX34211-ABX34288 are the antisense oligonucleotides which are directed against human SAA4 expression. Each antisense oligonucleotide has a phosphorothioate backbone, all cytidines residues are 5-methylcytidines and bases 1-5 and 16-20 are 2-methoxyethyl (2'-MOE) nucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 20;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20 BP; 3 A; 5 C; 9 G; 3 T; 0 U; 0 Other;

```
The present invention relates to novel antisense oligonucleotides (ABZ81522-ABZ81593) which are targeted to human protein kinase A (PKA) sequelatory subunit RII beta nucleotide sequence (BAZ8131), and which specifically hybridise with and inhibit the expression of the PKA regulatory subunit RII beta (PKA is also known as CAMP-dependent protein kinase). The antisense oligonucleotides are useful for modulating the expression of PKA regulatory subunit RII beta and for treating diseases or conditions associated with aberrant expression of PKA regulatory subunit RII beta and for treating diseases or subunit RII beta and for treating diseases subunit RII beta and for treating diseases or useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits, and in distinguishing between functions of various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                            The invention describes a new isolated pyruvate carboxylase polypeptide having an amino acid sequence at least 95% identical to a sequence comprising 1100 amino acids from Corynebacterium glutamicum, or the compliste amino acids from Corynebacterium glutamicum, or the the American Type Culture Collection. The polypeptide is useful as an anapherotic enzyme replenishing oxalcacetate consumed for biosynthesis during growth. The polypeptide is also useful for lysine or glutamic acid production in industrial fermentations. This sequence represents a primer used to sequence Corynebacterium glutamicum pyruvate carboxylase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; inhibitor-kappa B-R; I-kappaBR; IKBR; I-kappa-B-related; NFKBIL2; ikappab r; antisense; immune response; infection; inflammation; therapy; tumour; prophylaxis; phosphorothioate; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to antisense compounds targetted to a nucleic acid molecule encoding human inhibitor-kappa B-R (also known as I-kappaBR, IXBP, I-kappa-B-related, ikappabr, nuclear factor of kappa light polypeptides gene enhancer in B-cells inhibitor-like 2 and NFBIL2) to inhibit its expression. Autisense compounds of the invention are useful for treating diseases or conditions associated with the expression of inhibitor-kappa B-R auch as a heightened immune response involving increased cytokine expression, or a result of infection (e.g. bacterial, viral or parasitio). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between formation, as transumembers of a biological pathway. They are also useful in antisense therapy. The present sequence is an oligonucleotide targetted to human inhibitor-kappa B-R DNA

The present invention relates to High Bone Mass (HBM), LRP5 (Zmax1) and LRP6 mutants, which results in a HBM-like phenotype when expressed in a cell. The HBM-like phenotype results in bone mass modulation and/or lipid level modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence is a Sequence Tagged Site (STS) marker, which was used to prepare a physical map of the Zmax1 (LRPS) gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ss; PCR; human; anti-HIV; virucide; HIV; SIV; 88-C; 88-2B; chemokine receptor; envelope protein; atherosclerosis; rheumatoid arthritis; tumour growth suppression; asthma; viral infection; AIDS; inflammatory condition; primer.
                                                                                                                                                                                                                                                                                             New nucleic acid comprising a mutation in LRP5 or LRP6, useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject
                                                                                                                                                                                                                      Liu W;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to antisense compounds targetted to a nucleic acid encoding human MyD88 (wyeloid differentiation primary response gene 88) to inhibits its expression. Antisense compounds of the invention are useful for preparing a composition for treating neurodegenerative disease e.g. Alzheimer's disease, Down's syndrome or schizophrenia. The invention is also useful in gene therapy. The present sequence is an antisense oligonuclectide targetted to human MyD88 DNA
                                                                                     /mod_base= OTHER /note= "Phosphorothioate backbone; All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence tagged site #150 used to prepare Zmax1 (LRP5) gene region map.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense compound, having a sequence targeted to a nucleic acid encoding MyD88, useful for preparing a composition for treating neurodegenerative disease, e.g. Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           * X B X B X B X B X B X B B B B B B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X B X 
                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to screening for a modulator of human immunodeficiency virus (HIV) or simian immunodeficiency virus (HIV) or simian immunodeficiency virus (SIV) infection, comprising contacting a first composition having an human (ADC03341) or macaque (ADC03359) 88C chemckine receptor polypeptide with a second composition having an HIV or SIV envelope protein in the presence or absence of a compound. Also included are screening for a modulator of HIV infection, detecting HIV infection of cells (comprising contacting a cell that has been recombinantly modified to express at least one of human chemckine receptors 88C and 88-28 with HIV, and detecting HIV infection of cells (comprising contacting cells with an antibody to at least one of human chemckine receptors 88C and 88-28 with HIV, and detecting HIV infection of the cell after the contacting step). The methods and compositions of the present invention are useful for the diagnosis and compositions of disorders associated with the aberrant expression or activity of 88C or 88-28 beneathing selection, wirel infection, rheumatoid arthritis, tumour growth suppression, asthma, viral infection, and other inflammatory conditions. The genes for human 88-C and 88-28. Here are located on chromosome 3921. The present sequence is a PCR primer used to isolate cDNA encoding human chemckine receptors 88-28.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of a sense oligonucleotide that corresponds to the Kozak sequence of mouse SAMID mRNA (see ACF79541). It was used as control in experiments with the corresponding antisense oligonucleotide (see ACF79551). Selective inhibition of the mRNA showed that SAMID is crucially involved in meiotic acting sterol (MAS) signalling, since a functional knockout of de novo protein synthesis partly disrupted MAS signals in ocytes. SAMID is a transducer of MAS signalling and is involved in the gamete maturation process induced by 3beta-hydroxy 4,4-dimethyl cholest-8.14,24-triene (FF-MAS), specifically inducing germinal vesicle breakdown in mouse occyte cultures in vitro. SAMID can be used to acreen for agonists or antagonists of FF-MAS activity for use as antiinfertility or contraceptive drugs
                                                                                                                                                                                   New polynucleotide encoding a transducer of meiotic acting sterols-
signaling or its regulatory domain, useful for isolating tissue specific
variants of the transducer which may be used as anti-infertility or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /mod_base= OTHER

New polynucleotide encoding a transducer of meiotic acting sterols-signaling or its regulatory domain, useful for isolating tissue specific variants of the transducer which may be used as anti-infertility or contraception drugs

Example 1; Page 18; 55pp; English.

The present sequence is that of an antisense oligonucleotide that is complementary to the Kozak sequence of mouse SAMID mRNA (see ACF79541). Selective inhibition of the mRNA showed that SAMID is crucially involved in meiotic acting sterol (MAS) signalling, since a functional knockout of de novo protein synthesis partly disrupted MAS signals in occytes. SAMID is a transducer of MAS signalling and is involved in the gamete maturation process induced by 3beta-hydroxy-4,-4-dimethyl cholest-8,14,24-triene (FF-MAS), specifically inducing germinal vesicle breakdown in mouse oocyte cultures in vitro. SAMID can be used to screen for agonists or antagonists of FF-MAS activity for use as antiinfertility or contraceptive drugs

Screening for estrogen analog, by administering test compound to rodents, isolating hippocampus, monitoring for the expression of a particular gene in hippocampus, and selecting compound that alters gene expression.

Disclosure; Fig 2; 16pp; Japanese.

The invention relates to screening for an oestrogen analogue, comprising administering a test compound to rodents, isolating hippocampus from rodents, monitoring for the expression level of a gene comprising mouse calmodulin I, chimaerin, neuromedin, T-Rec-alpha rel., 3B-HSD related protein, ATP-binding cass., chaperonin, HCNP, histone-like protein, the hippocampus and selecting a compound that alters the gene expression as oestrogen analogue. The method is useful for screening for oestrogen analogues. The identified compound is useful for studying the effect of ADCS 6839/

Novel antisense compound targeted to 5' untranslated region, coding region, or intron:exon junction of nucleic acid molecule encoding mdm2. useful for treating e.g. cancer, psoriasis or restenosis by inhibiting expression

Example 17; SEQ ID NO 300; 289pp; English.

The invention comprises antisense oligonucleotides which are targeted to the human mdm2 gene. The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonucleotides are also useful for acceptable in the appropriate and also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligonucleotide of the invention. The present sequence contains 2'-methoxyethoxy-residues and has a

The invention describes a compound (I) 8-80 nucleobases in length targeted to a nucleic acid molecule encoding hydroxysteroid 11-beta dehydrogenase 1. inhibiting expression of hydroxysteroid 11-beta dehydrogenase 1. The methods and compositions of the present invention are useful for treating disorders associated with hydroxysteroid 11-beta dehydrogenase 1 expression, such as osteoporosis, depression and metabolic disorders like obesity, diabetes, atherosclerosis and hyperlipidaemia. This sequence represents an antisense oligonucleotide used to control the expression of mouse hydroxysteroid 11-beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  hydroxysteroid 11-beta dehydrogenase 1 expression, such as osteoporosis, depression and metabolic disorders like obesity, diabetes and atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compounds useful for treating disorders associated with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel method for treating melanoma cells in vitro which involves reducing tyrosinase-related protein-2 (TYRP2) in melanoma cells in vitro by contacting the cells with an antisense oligonuclectide targeting TYRP2 mRNA so that expression of TYRP2 is reduced. Subsequently, an anti-cancer therapy is administered to the cells. The molecules of the invention demonstrate cytostatic activity whilst the method of the invention may be useful for treating melanoma cells in vitro via antisense therapy. The method obviates or mitigates the one or more shortcomings of conventional methods and by selectively trageting TYRP2, resistance to anti-cancer therapy can be reduced or traversed. The current sequence is that of the human TYRP2-targeted antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Treating melanoma cells in vitro involves reducing tyrosinase-related protein-2 in melanoma cells by contacting cells with antisense oligonucleotide targeting TYRP2 mRNA, and administering anti-cancer

                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                        gene for a structural protein of cartilage comprising a sequence identified in Table I (Page 18-31). Table I includes 179 primer sequences (see AAQ65728-Q65906). The following details are given for primer 70: Alt. Code: DH-62 Region/exon: 42/43 Direction: sense Primer position: 17618 (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 18 claims primers for use in detecting mutations in a mammalian gene for a structural protein of cartilage comprising a sequence identified in Table I (Page 18-31). Table I includes 179 primer sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting genetic pre-disposition to osteoarthritis - and other diseases involving mutation in cartilage protein genes, by amplification and analysis of DNA and comparison with standards.
                                                                                                    Detecting genetic pre-disposition to osteoarthritis - and other diseases involving mutation in cartilage protein genes, by amplification and analysis of DNA and comparison with standards.
                                                                                                                                                                             Claim 18 claims primers for use in detecting mutations in a mammalian

(see AAQ65728-Q65906). The following details are given for primer 67:
Alt. Code: DH-59 Region/exon: 40/41 Direction: antisense Primer position:
17638 (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide nucleic acid probes for detection of ribosomal nucleic acid of mycobacteria - allow differentiation between species of tuberculosis complex and others and can penetrate cell membranes without pretreatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This is the nucleotide sequence of the peptide nucleic acid (PNA) probe used in the method of the invention, to detect ribosomal nucleic acid of mycobacteria. The probes are used, in situ or in vitro, for detection of the Mycobacterium tuberculosis complex (MTC), specifically M. tuberculosis, and especially in sputum samples, but also in other body fluids, blopsy specimens, foods, soil, air and water. Particularly, they are used to diagnose, stage or monitor infection, or for identification of drug-resistant strains (which generally have mutations in rRNA)
                                                                                                                                                                                                                                                                         Gaps

```
The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the target be binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatotellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune carcinoma.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, disease, kidhey disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

```
New oligo nucleoside(s) and nucleotide(s) with up to 200 bases - nuclease resistant anti sense cpds. useful for treating hereditary disorders of altered genetic expression mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Two TEG molecules joined via a phosphate group are attached to the 5' terminus. The cytidine residue at position 15 is attached to the 3' adenosine residue by two TEG molecules which are joined via a phosphate group. The diol-contg. linking group forms phosphodiester bonds with C and A. The resulting oligonucleotide is resistant to exonuclease degradation. See also AAQ21884-Q21895 and AAQ21897-Q21918
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, single nucleotide polymorphism; SNP, genotyping; DNA analysis; allele specific oligonucleotide; ASO; reduced complexity genome; RCG; genomic classification; identification; DNA fingerprinting;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       **********
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HB) to hairpin (HB) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV control of the substrate sequences defined in the specification. The HCV They can be used to treat cirrhosis, liver failure and/or replication of hepatocellular carcinoma. The HCV ribozymes are also useful for treating conterfer drug therapies, particularly type I interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic formet directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô

A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic classification code for a genome. The method can be used to characterise a tumour, to generate a genomic classification code for a genome. The method can be used whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948 to AAA35632 represent nucleotide sequences containing SNPs
                                                                                                                                                                                                                                                                                                                                                             Detection of single nucleotide polymorphisms in genomes by preparation and analysis of reduced complexity genomes, useful for genotyping, fingerprinting and determining allele frequency of SNPs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 17 BP; 5 A; 3 C; 3 G; 6 T; 0 U; 0 Other;

RIBOZYME PHARM (RIBO-)

BLATT L. MCSWIGGEN J. CHOWRIRA B M. (BLAT/) (MCSW/)

Chowrira BM; Mcswiggen J, Blatt L,

WPI; 2001-607195/69.

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 87; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cepulates expression of a neurite growth inhibitor gene (NGOD). The cegulates expression of a neurite growth inhibitor gene (NGOD). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids (e.g. a ribozyme or a possessing an NCH motif), a C-dleaver (cleaving RNA with a NRN motif) properties and presence of a divalent cation that is preferably MG-2+.

The DRAZYMA with an NON triplet), a zinzyme (cleaving RNA with a VGV motif). The CD20-targetting nucleic acid is used to cleave RNA cof CD20 in the presence of a divalent cation that is preferably MG-2+.

Furthermore, it may be contacted with a coll to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma (MCL), immunocytoma (IMC) annul bromboytic lymphocytic lymphoma, coll in uncleic acid is used to inflammatory arthropathy. The NOGO gene in the presence of a divalent cation that is preferably MG-2+. Furthermore, the cucleic acid may be contacted with a coll to reduce NOGO activity of the cell and treat a patient having a condition associated with the level of colland treat a patient having a condition associated with the level of the treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to

Claim 7; Page 246; 294pp; English.

The present invention provides single-stranded oligonucleotides which can oligonucleotide has at least one mismatch compared with the genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoplastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKOZA), APC, Factor V, Factor VII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6,

apolipoprotein E (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presentlin-1 (PSEN1) and presentlin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deamliase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, volin-dependent kinase inhibitor 2A (CDRN2A), APC, Factor VII, Factor IX, haemoglobin alpha locus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, gene therapy, adenosine deaminase deficiency; p53; beta-globin, retinoblastoma; BRCA1; BRCA2, CFTR, cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDKN2A; melanoma; ABC; HBA2, HBA2, adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOE; mismatch repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein E; LDLR; familial hypercholesterolaemia; UGT1; syndrome; APP; FSENI; antisense; UDP-qlucuronosyltransferase; amyloid precursor protein; presenilin-1; Alzheimer's disease; cytostatic; antisickling; antianaemic; haemostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligonuclectide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein E (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presentiln-1 (PSEN1) and presentiln-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, such as cancer, adenosine deaminase deficiency, cystic fibrosis, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting
                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     retinoblatoma; BRCA1; BRCA2; CFTR, cystic fibrosis; cancer; Factor V, cyclin-dependent kinase inhibitor 2A; CDKN2A; melanoma; APC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VI; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOB; mismatch repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein E; LDLR; familial hypercholestercolaemia; UGT1; syndrome, APP; PSEN1; antisense; UDP-glucurchosyltransferase; amyloid precursor protein; presentlin-1; Alzheimer's disease; cytostatic; antisickling; antianaemic; haemostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gene therapy; adenosine deaminase deficiency; p53; beta-globin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical

(CDKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein E (APOB), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presentlin-1 (PSEN1) and presentlin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, hamemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; gene therapy, adenosine deaminase deficiency; p53; beta-globin; retinoblastoma; BRCA1; BRCA2; CFTR; cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDKN2A; melanoma; APC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOS; mismatch repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein B; LDLR; familial hyperchesterolaemia; UGTI; syndrome; APP; PSEN1; antisense; UDP-qiucuronosyltransferase; amyloid precursor protein; presentilin-1; Alzheimer's disease; cytostatic; antisickling; antianaemic; haemostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical

the following genes: adenosine deaminas, insers aguarded as the following genes: adenosine deaminas, insers aguarded as tetinoblastoma BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDMNAA), ABC, Factor V, Factor IX, Aeamoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein E (APOE), LDL receptor (LDLR), uDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presentlin-1 (FSENI) and presentlin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer: diseases, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention

0

sequence to be altered. In particular, these sequences are directed at the following genes: adenosine desminant of the contractions

The present invention relates to oligonucleotides that downregulate the expression of human Grb2-related with Insert Domain (GRID) gene. GRID is a T-cell co-stimulatory adaptor protein. The oligonucleotides are useful for modulating the expression of GRID, to treat conditions such as tissue/graft rejection and leukaemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation, chemotherapy and cyclosporin treatment. The present oligonucleotide was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Domain

```

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic

Oligonuclectide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a method for predicting the potential of an oligonucleotide to hybridise to a (complementary) target nucleotide sequence, involving identifying a subset of oligonucleotides within the predetermined number of unique oligonucleotides based on the evaluation of the parameter. Oligonucleotides in the subset are identified that are clustered along a region of the nucleotide sequence that is hybridisable to the target nucleotide sequence. This is useful for evaluating oligonucleotide probe sequences. The present sequence is an oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                              Predicting the potential of an oligomucleotide to hybridize to a target nucleotide sequence, useful for evaluating oligonucleotide probe sequences, by identifying a oligonucleotides based on the evaluation of

The present invention describes a method for predicting the potential of an oligomucleotide to hybridise to a (complementary) target mucleotide sequence, involving identifying a subset of oligomucleotides within the predetermined number of unique oligomucleotides based on the evaluation of the parameter. Oligomucleotides in the subset are identified that are clustered along a region of the nucleotide sequence that is hybridisable to the target nucleotide sequence. This is useful for evaluating oligomucleotide probe sequences. The present sequence is an oligomucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Predicting the potential of an oligonuclectide to hybridize to a target nucleotide sequence, useful for evaluating oligonucleotide probe sequences, by identifying a oligonucleotides based on the evaluation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, genome-derived myosin-like protein 1, GDMLP-1, hGDMLP-1, heart;

 The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates, to nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP-Proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as therefore, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a disorder sequence represents an oligomer used in the screening of the horselve the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fire, wipo.int/pub/published_pot_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                  New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynuclectide sequences of hGDMLP-1 clan be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates from the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specific biomolecule and/or amount specifically recognise hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this pattent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates, to nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as upplement in pastients having specific deficiency in hGDMLP-1 proteins, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The conduction, and in vaccines or for replacement therapy. The production as skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The protein and polymucleotide sequences of hGDMLP-1 lean be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used probes to detect, characterise and quantify hGDMLP-1 mucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                               Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

consist to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modifications of the oligonucleotide. The chemical modifications of consist of ormethyl modification, an LNA modification, two or more phosphorothicate linkages on a terminus, or a combination of any two or compressions. The oligonucleotides are useful for directing repair or alteration of plant genetic information. The coligonucleotides are particularly useful for creating plants with desired of phonotypes, e.g. environmental or abiotic stress tolerance, improved nutritional value (e.g. altering amino acid content of plants or conferring amino acid over production), herbicide resistance (e.g. altering amino acid out triazine resistance, or grown triazine and sulphonylurea herbicide resistance, porphyric herbicide resistance or triazine resistance).

C glyphosate resistance, midazolinone and sulphonylurea herbicide resistance, porphyric herbicide resistance or triazine resistance).

C disease resistance, modified oil production of modified fatry acid content of e.g. increased starch or production of waxy starch), altered floral corpusion production of waxy starch), altered floral corpusion production of ways starch), altered floral corpusion of modified fatry acid content of e.g. reduced plantster, increased stearate or reduced linolenic acid).

C The oligonucleotides are also useful for producing albino mutants for the analysis of photosynthetic processes. This sequence represents a genome of altering oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chromosomal genomic alteration, genome altering oligonuclectide, PCR, ss, o-methyl modification, LNA modification, phosphorothioate linkage; DNA repair, DNA alteration, environmental tolerance, hygromycin-B, abiotic stress tolerance, improved nutritional value, hygromycin, primer, amino acid over production; herbicide resistance, glyphosate resistance, porphyric herbicide resistance, sulphonylurea herbicide resistance, prophyric herbicide resistance, triazine resistance, altered floral morphology; male-sterile plant; albino mutant; andified fatty acid content; reduced palmitate production; albino plant; albino mutant; in the case of stearch production; albino mutant; in the case of stearch production; albino plant; albino mutant; albino plant; albino mutant; al
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Reduced palmitate production genome altering oligonucleotide #47.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1.6%; Score 13.4; DB 1; Length 17; 93.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chromosomal genomic alteration; genome altering oligonucleotide; PCR; ss; o-methyl modification; LNA modification; phosphorothioate linkage; DNA repair; DNA alteration; environmental tolerance; hygromycin; bind alteration; dever production; modificational value; hygromycin; primer; amino acid over production; herbicide resistance; glyphosate resistance; porphyric herbicide resistance; sulphonylurea herbicide resistance; porphyric herbicide resistance; triazine resistance; disease resistance; modified oil production; modified starch production; waxy starch; modified factal morphology; male sterile plant; albino mutant; modified stearte production; albino plant; increased stearte production; reduced linolenic acid production; albino plant; increased stearte production; reduced linolenic acid production;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolersuce, improved nutritional value, herbicide or disease resistance, or modified oil
       production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an oligonucleotide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonucleotide having a DNA domain. The DNA domain has at least one mismatch with

New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil production

Claim 7; Page 170; 220pp; English.

The invention relates to an oligonucleotide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonucleotide having a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modification, an LNA modification, two or more phosphorothicate linkages on a terminus, or a combination of any two or more phosphorothicate linkages on a terminus, or a combination of any two or consist of ormetry modifications. The oligonucleotides are useful for directing repair or alteration of plant genetic information. The oligonucleotides are particularly useful for creating plants with desired phenotypes, e.g. environmental or abiotic stress tolerance, improved conferring amino acid content of plants or conferring anino acid over production), herbicide resistance (e.g. altering amino acid content of plants or conferring amino acid use tarchology care resistance, inidazolinone and sulphomylurea herbicide resistance, or production of waxy starch), altered floral corphology (e.g. male-sterile plants) or modified fatty acid content of e.g. increased starch or production, modified starch production (e.g. increased starch or production of waxy starch), altered floral corphology (e.g. male-sterile plants) or modified fatty acid content of e.g. enale-sterile plants) or modified fatty acid content or the oligonucleotides are also useful for producing albino mutants for the analysis of photosynthetic processes. This sequence represents a genome altering oligonucleotide of the invention

Novel polynucleotide which down regulates expression of Ets-related gen useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

Claim 4; Page 129; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour anglogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, anglofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for cleaving RNA of ERG gene, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting the cell with (I). (I) is useful for specifically cleases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect targeting genes that share homology with ERG gene or ERG fusion genes. ABRI7354-ABRZ2719 represent nucleic acids, including antisense and contacting confidence of more acids, including antisense and contacting confidence of more acids, including antisense and contacting the confidence of more acids, including antisense and contacting more acids. related PCR primers of the invention

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, veruca vulgaris, angiofibroma of tuberous sclerosis, portwine stains, Sturge where syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu syndrome, Ieukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting calls of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment. Leukaemia or tumour condictions valuable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for genein collitions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically cargeting genes that share homology with ERG gene or ERG fusion genes. ABK17354-ABK22719 represent nucleic acids, including antisense and cargeting cargeting genes that share homology with ERG gene or ERG fusion genes. Service of more coller acids, including antisense and collers acid molecules which regulate expression of ERG, and

Human ERG hammerhead ribozyme target sequence, Seq ID No 1073.

Human; hammerhead ribozyme; cytostatic; antitumour; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Ewing's sarcoma; melanoma; psoriasis; tumour andiogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; angiofibroma of tuberous sclerosis; port-wine stain; wound healing; Sturge Weber syndrome; Kippel-Trenaunay Weber syndrome; leukaemia; se; Osler-Weber-rendu syndrome; leukaemia; osteoporosis; DNAzyme; inozyme;

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sacroma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-whos stains, Sturge where syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment. Eukaemia or tumour conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically cargeting genes that share homology with ERG gene or ERC fusion genes. ABRIJ354-ABK2219 represent nucleic acids, including antisense and contacting the contactines which regulate expression of ERG, and contacting cell molecules which regulate expression of ERG, and contacting enemals. Novel polymucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome. Tumour suppression related human fukutin oligo SEQ ID No 4563. (first entry)

Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip;

human fukutin; ds

```
The invention relates to a novel isolated 17 mer mucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of alignment, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, colls containing the nucleic acids, cells containing the nucleic acids, cells containing the nucleic acids, cells containing the nucleic acids, cells containing the nucleic acids, cells containing the nucleic acids, cells containing the nucleic acids for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and scharacterised by development of the 17 mer nucleic acids in containing the polypeptides can also be used to generate antibodies, and contained samples is useful for disapnosis and/or prognosis of these contained acid sequences of the invention can be used in gene therapy. This polyputcleotide sequence represents a tumour suppression contained the acids have an expension of the invention can be used in gene therapy. This polyputcleotide sequence represents a tumour suppression contained the acids and antibodies are useful to be acids to generate antibodies.

```
The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12 MDZ3 is proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12, MDZ12, MDZ12, MDZ12 is encoded at chromosome 6P21.3-22.2, MDZ7 is encoded at chromosome 16P11.2 and MDZ12 is encoded at chromosome 16P12 is encoded at chromosome 16P12 is encoded at chromosome 16P12, and MDZ12 is encoded at chromosome 16P12, and MDZ12 is encoded at chromosome 16P2, is encoded at chromosome 16P12, and MDZ12 is encoded at chromosome 16P2, is encoded at chromosome 16P2, MDZ1, is encoded at chromosome 16P2, MDZ1, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease acides and proteins are probes to detect and characterize gross also be used as probes to detect and characterize gross also mbZ2, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.
                                                                                                                                                                                             New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SHARIN KRIKER KENKOK GARAKER KERAKAKE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is cancded at chromosome 7422.1. MD24 is encoded at chromosome 6721.3.22.2.

MD27 is encoded at chromosome 1601.2 and MD212 is encoded at chromosome some 15q26.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy, or imanufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are proteins are useful as therapeutic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, H-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are laso useful for treating breat, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ65216, ABZ65531, ABZ65520 - ABZ65524, ABZ65530 - ABZ65520 - ABZ65524, ribozymes of the invention Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences. Claim 4; Page 149; 185pp; English.

Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus

Claim 1; Page 281; 387pp; English.

infection.

The present invention relates to nucleic acid molecules which modulate
the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,
inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
are nucleic acid decory molecules and aptemers that bind to HBV reverse
transcriptase and/or HBV reverse transcriptase primer sequences, as well
as oligonucleotides that specifically bind the Enhancer I region of HBV
DNA. The nucleic acids may be used to modulate the expression of HBV
compounds and/or potential theraples directed against HBV, and compounds
that modulate the expression and/or replication of HGV. The compounds and
methods of the invention are useful for the treatment of degenerative and
disease states related to HBV and HCV infection, replication and gene
expression such as cirrhosis, liver failure, and hepatocellular
carcinoma. The present sequence represents a substrate for one of the HCV
DNAzyme or minus strand DNAzyme sequences disclosed in the present Nucleic acid molecule, Hepatitis C virus; HCV; Hepatitis B virus, HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme; Gaps .; 0 1.6%; Score 13.4; DB 1; Length 17; 66.7%; Pred. The present invention relates to murine oligonuclectides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonuclectides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and (2) for production of recombinant polypeptides. The oligonuclectides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that
                                                                                                                                                                                                                                                                            New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as harmerhead ribozymes, DNAzymes, amberzymes, and G-cleaver ribozymes, DNAzymes, care nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or potential therapies directed against HBV, and compounds methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytostatic, virucide, neuroprotective, nootropic, neuroleptic, murine, tumour suppression, tumour reversion, apoptosis, virus resistance, viral disease, tumour, cell degeneration, cancer, Alzheimer's disease,

The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia

Predicting potential of oligonucleotides to hybridize to target nucleotide sequence comprises determining and evaluating for each oligonucleotide a parameter predictive of the oligonucleotides ability to nybridize with target.

Example 1; SEQ ID NO 109; 423pp; English.

The invention relates to a method of predicting the potential of oligonucleotides to hybridise to target nucleotide sequences. The method is useful for predicting the potential of an oligonucleotide to hybridise to a target nucleotide sequence, e.g. RNA or DNA or a sequence that contains chemically modified nucleotides. The method is also useful for predicting the potential of the oligonucleotides to hybridise to a complementary target nucleotide sequence. The method is useful to predict efficient hybridisation oligonucleotides for each of multiple target

The sequences given in AAT48840-41 are primers which were used in the amplification of the rat type II non-pancreatic phospholipase A2 (PLA28) gene. Mutations within this sequence may lead to an individual having an increased risk of colon cancer. The method of the invention comprises: (a) isolating genetic material from a tissue or body fluid sample from the individual; and (b) detecting a PLA28 gene mutation which is indicative of the individual is at an elevated risk of colon cancer; or an isolated protein sample which is indicative of the individual having an elevated protein sample which is indicative of the individual having an elevated risk of colon cancer. The method allows individuals with the treatment of colon cancer. The method allows individuals with the treatment of colon cancer, the patient is administered a recombinant vector incorporated within a non-toxic enteric microorganism which

```
the expression of a target nucleic acid (tNA) sequence via binding to the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (i) a method of defining a set of oligonuclectides (ONS) that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria, and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical, chemical or bioactive properties. Information gathered from assays of such compounds is used to identify nucleic acid sequences that are tractable to a variety of nucleotide sequence-based technologies e.g. antisense drug discovery and target validation. Sequences AAZ06571-Z06607 are antisense polymucleotides targeted to a nucleic acid molecule encoding human ELK-1 (also known as p62TCF). ELK-1 is a member of the ternary complex factor subfamily of Ets-domain transcription factor proteins. The polymucleotides inhibit the expression of human ELK-1, and this sequence targets the 3' untranslated region of the ELK-1 RNA. Sequences AAZ06571-Z06607 all cause at least 30% inhibit the expression of human ELK-1 in human cells or tissues in vitro. ELK-1 uses a bipartite recognition mechanism mediated by both protein-DNA and protein-protein interactions to regulate genes by direct and indirect DNA binding and other cell functions including apoptosis. This means that antisense compounds inhibiting expression of ELK-1 can be used to treat diseases associated with its expression in animals, particularly humans and to prevent or delay infection, inflammation or tumour formation. The compounds can also be used for diagnosis, as research reagents and in

The present invention relates to a method for detecting and identifying Salmonella in food, personal care products e.g. toothpaste, cosmetics and shampoos, pharmaceutical products and/ or water. The present sequence is a nucleic acid probe specific for S. typhimurium 23s rRNA gene. The probe may be used to identify and detect Salmonella with high specificity, using probe hybridisation and PCR

Seguence 18 BP; 4 A; 5 C; 4 G; 5 T; 0 U; 0 Other;

Specific detection of Salmonella in a sample e.g. food or water, comprising using a polynucleotide which hybridizes to a region of the 23S rRNA gene sequence from Salmonella typhimurium.

The present invention describes a collection of binding groups for a family of nucleic acids comprising members of relative high and relative low significance, where the binding groups are selected to be capable to identify, alone or in combination, essentially all members of the family of nucleic acids of relatively high significance. The collection of binding groups is useful for typing of nucleic acid in a clinical sample, by contacting the nucleic acid with the collection and determining whether one or more binding groups bound to the nucleic acid of the sample. This method is useful for determining whether the sample comprises at least a part of a member of relatively high significance of a family of nucleic acids. The collection of binding groups is useful for diagnosing the severity of a disease caused by a pathogen containing a member of a family of nucleic acids. ABL88779 to ABL89321 represent

(WRX1), lactotransferate (GTM2), multidrug resistance 13
(WRX1), lactotransferate receptor (WRX12), criMX3, CHNR4, or CHNR5) sequence
(WRX2B4), orphan muclear receptor (WRX12), multidrug resistance 13
(WRX1), lactotransferase for locating and characterising the genes that
are responsible for specific traits within the genome and eventually
creceptor 1, 2, 3, 4, or 5 (GTMR1), GHNR2, CHNR4, CTMR5, GENRA, CHNR5) sequence
contained to their esq., overexpression, constitutive
are responsible for taspecific ordinal for alcered drug
craits as a result of their esq., overexpression, constitutive
confort treating the disorders. The mucleic acid molecules comprising the
polymorphic sequences contained in CYP4501A1, CYP4501A2,
ANR, MDR1 and/or MDR3 are useful for screening individuals for alcered drug
consecutivity to coloreral tumours, in DR10 correal individuals for alcered contral
cused to screen for allered cardiovacular function, in CYP4501A1, CYP4501A2,
immunological or haematological function, in KRX2 for altered central
consecutivity in the prostate, in LPF for alte Isolated nucleic acid molecules having polymorphisms in known human genes eg. cyrochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits. 1.6%; Score 13.4; DB 1; Length 18; 93.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                            ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the intitation codon, coding regaion, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiple amendory steroid in a subject, for reducing levels of adenosine of ceptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
